Sry Hello, I am running Ubuntu 13.10 on a Virtual Machine. I cannot connect to the Internet. It used to work. Does anyone have an idea? Mac10, so it is neither binary or proprietary And I need to have a auto login or just to install the drivers? Can you help? mac44: Since you are running a free driver, just install the driver. !details | del_diablo del_diablo: Please give us full details. For example: "I have a problem with..., I'm running Ubuntu version.... When I try to do..., I get the following output:..., but I expected it to do..." I have to install the drivers for my screen, Asus a220h? mac44: So please install the drivers for your display, and you should be fine. I'm doing it now, I cannot move mac44: Then dont. And I have a problem with my touch screen Do I need to change the drivers? mac44: I dont know - I dont care. You have to run some settings you dont know. mac44: You have to run some settings for which you dont know. You have to run some settings which have to do with which you dont know. So I dont care anymore. is there a known bug in libvirt, or have there been changes to libvirt that cause a certain libvirt xml file to break with udev rules? nevermind, figured it out. just ran into this bug: Hello all. I am running ubuntu 14.04, and I am having a small issue with software updater. When I start the software updater, it doesn't find any updates, and when I run the command "sudo apt-get update", it 82157476af
